EXCELERATE INTERNSHIP | WEEK 4

Opportunity & Learner Performance Analysis

Findings, dashboard outputs and recommendations

Emmanuel Erioluwa Olowodu

Two datasets, very different shapes

Opportunity Data

5,733

records | 33 fields

- Category, fee, currency, duration, location and key dates
- Six categories lead; fees are recorded in USD, INR and EUR
- Nine fields hold embedded JSON references, not usable values

Learner Data

1,979

records | 256 fields

- Status, apply and completion dates, lead source and payment
- Only 44 of 256 columns carry real names
- Status is stored as undecoded numeric codes

Five steps, each backed by a SQL check

1

Load

Created a Supabase PostgreSQL database and imported both CSV files.

Check: Row counts matched the source files (5,733 and 1,979).

2

Explore

Profiled structure, categories, missing values and duplicates with SQL.

Check: opportunity_id confirmed unique.

3

Clean

Worked on copies of each table: standardised text, fixed types, removed invalid values.

Check: Before and after counts compared.

4

Integrate

Tested seven candidate keys, then joined on category where no record key existed.

Check: Join tested at three levels of strictness.

5

Visualise

Built nine charts in Looker Studio across three pages.

Check: Each figure reconciled to a SQL result.

Cleaning made the data consistent and trustworthy

Location values

23 to 14

Spelling and case variants merged, such as Virtual, virtual and WFM.

Duration units

18 to 6

Singular and plural forms and typos consolidated.

Lead sources

14 to 10

Social Media and Illinois Tech variants merged into single labels.

Payment amounts

8 rows

Impossible values removed. The column total fell from about 30 trillion to 14,234.

- Six corrupted opportunity records were removed (5,733 to 5,727), and text “NULL” was converted to true missing values.
- All cleaning ran on copies, so the original imports stay untouched for comparison.

No shared record key, so we integrated by category

7 **candidate join fields tested, none reliable**

- relation_id, work_item_sk, the cohort fields and code produced zero matches or false positives
- False positives came from non-unique keys and corrupted rows
- Both tables share category, so a category-level summary was built
- A bridge table linking learners to opportunity IDs is needed for record-level analysis

The dashboard: three pages, nine validated charts

Page 1 | Opportunity Performance

- **1** Opportunities by category
- **2** Average fee by category
- **3** Learner records by category
- **4** Completions by category

Page 2 | Learner Activity

- **5** Applications per day
- **6** Applications per month
- **7** Records by payment status

Page 3 | Lead Sources & Trend

- **8** Learner records by lead source
- **9** Q4 2025 vs Q1 2026

Every figure was reconciled to a SQL query, and notes on the dashboard explain where the data limits a chart.

OPPORTUNITY PERFORMANCE

Excelerate: Opportunity & Learner Dashboard".

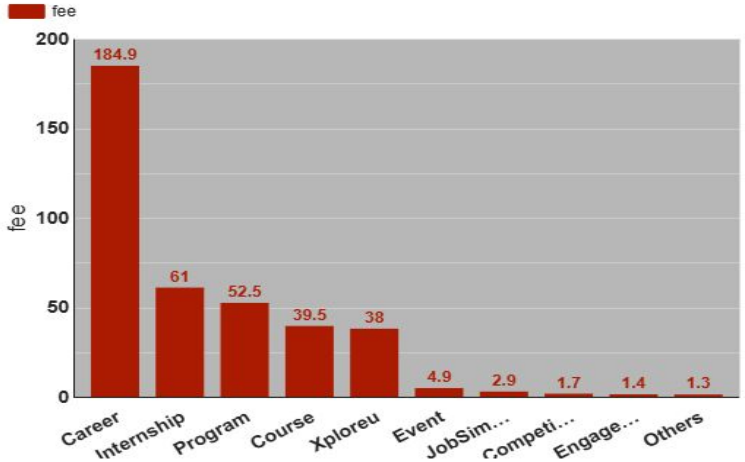

Reset | Share | Edit

- Opportunity Performance
- Learner Activity
- Lead Sources & Quarterly Tr...

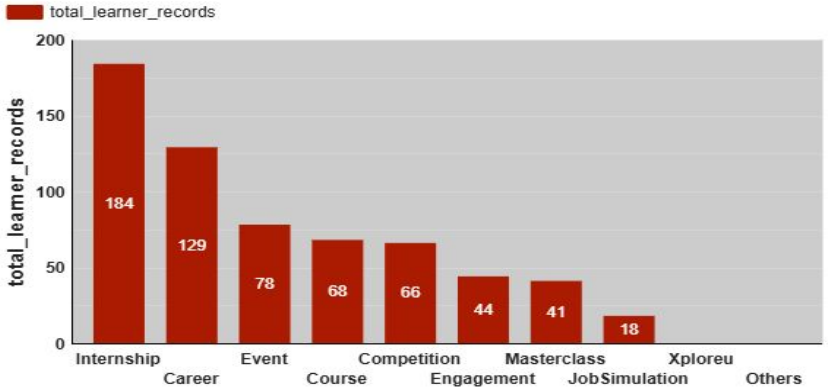

Opportunities by category

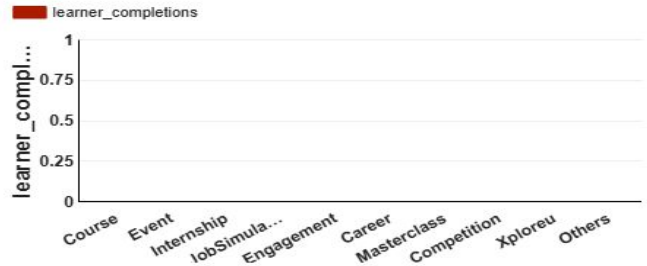

Average fee by category

Sign-Ups by category

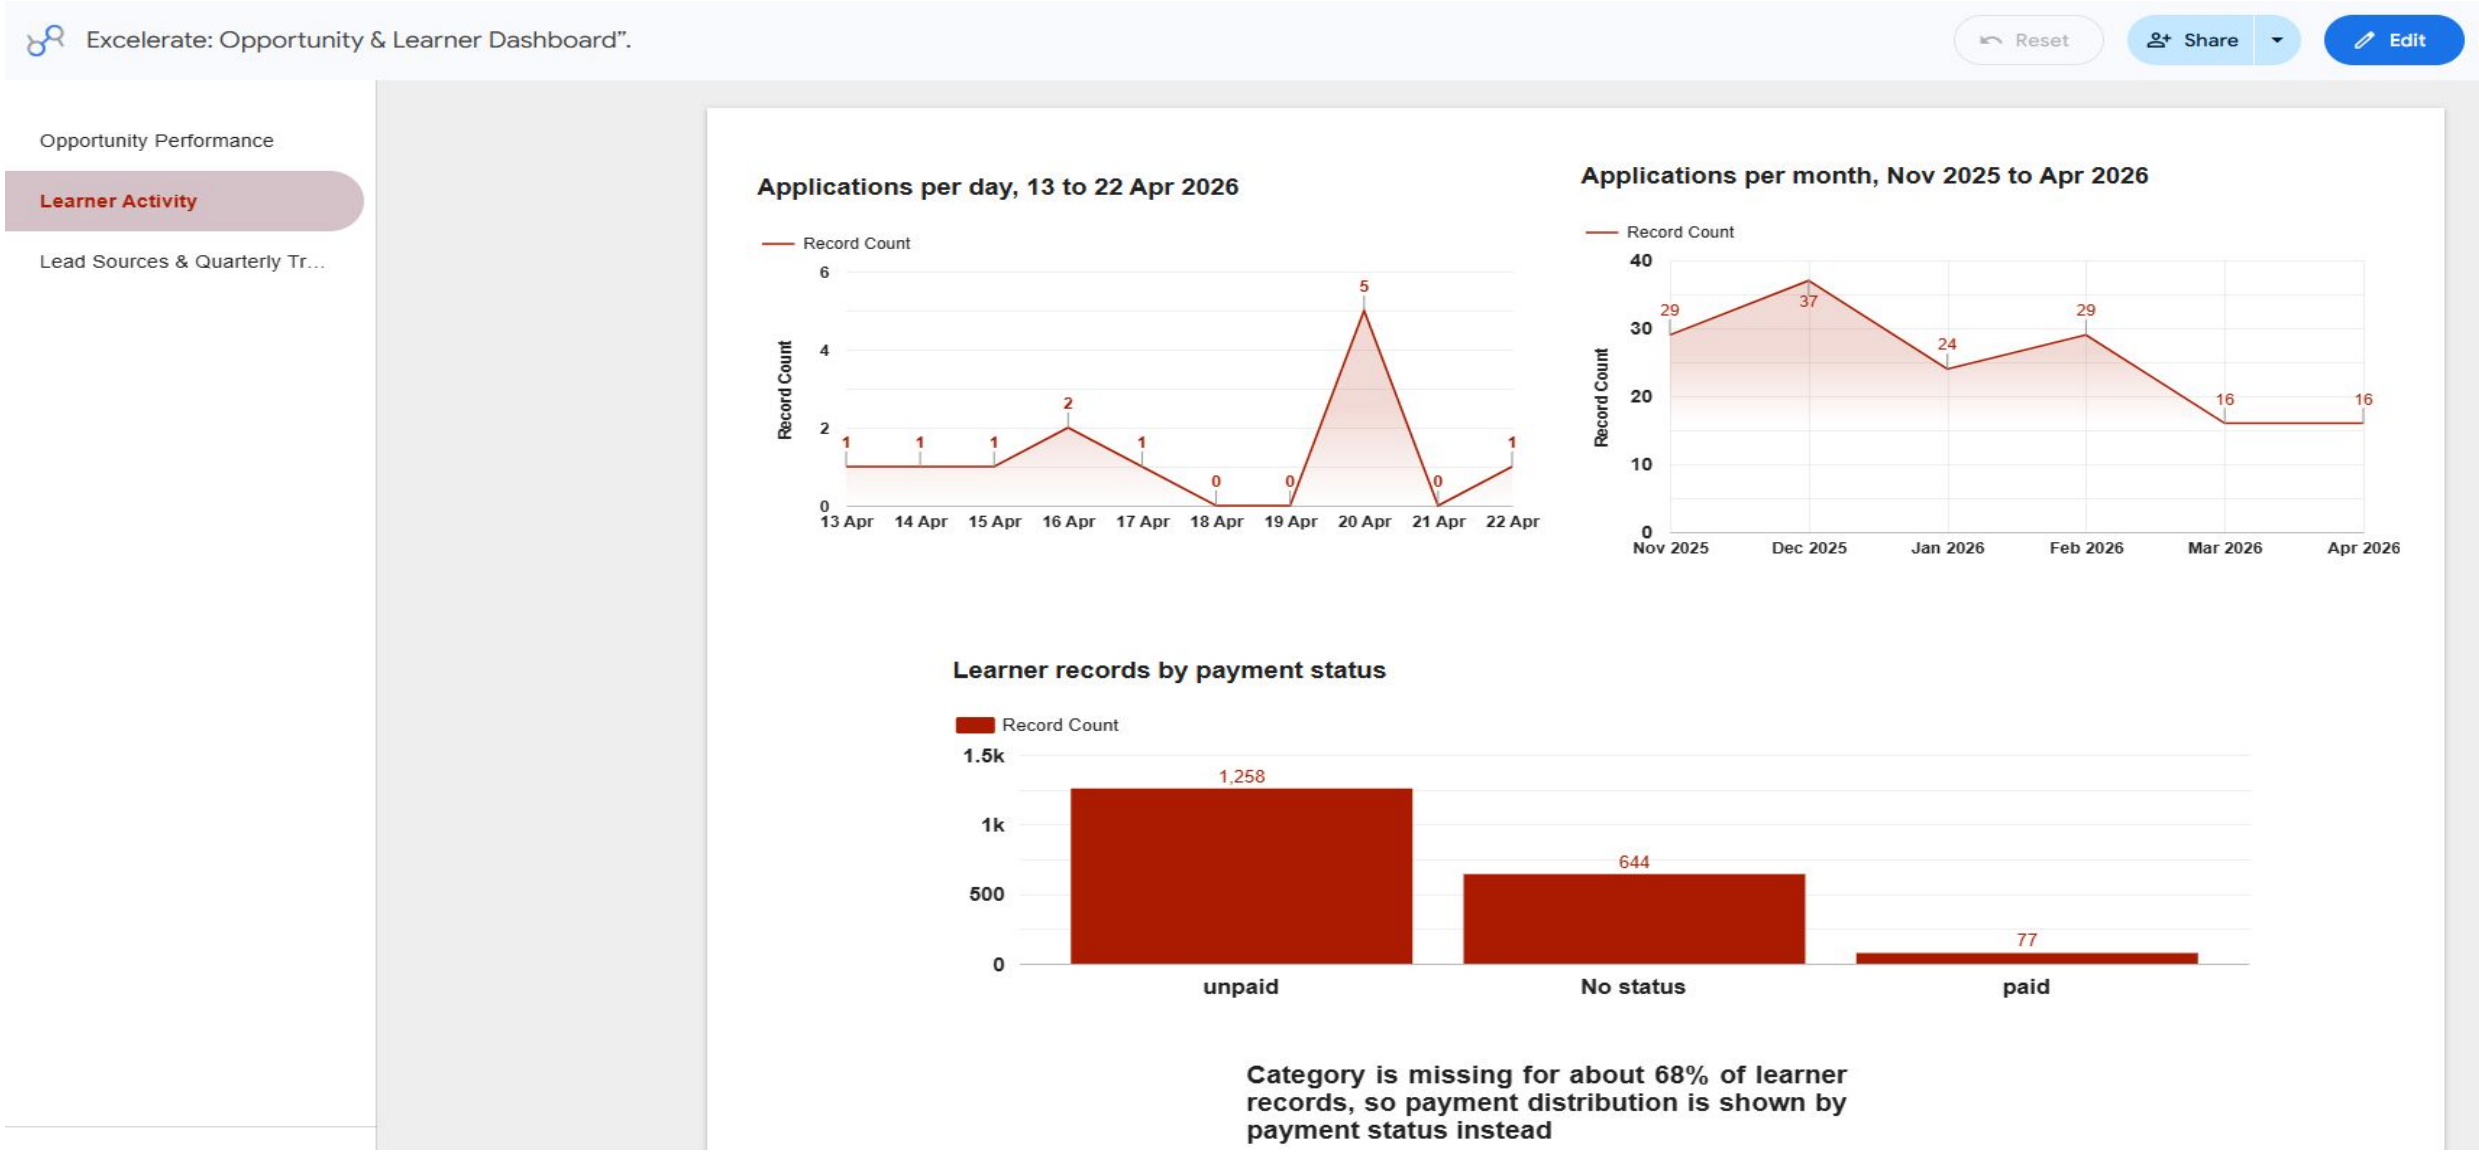

Completions by category

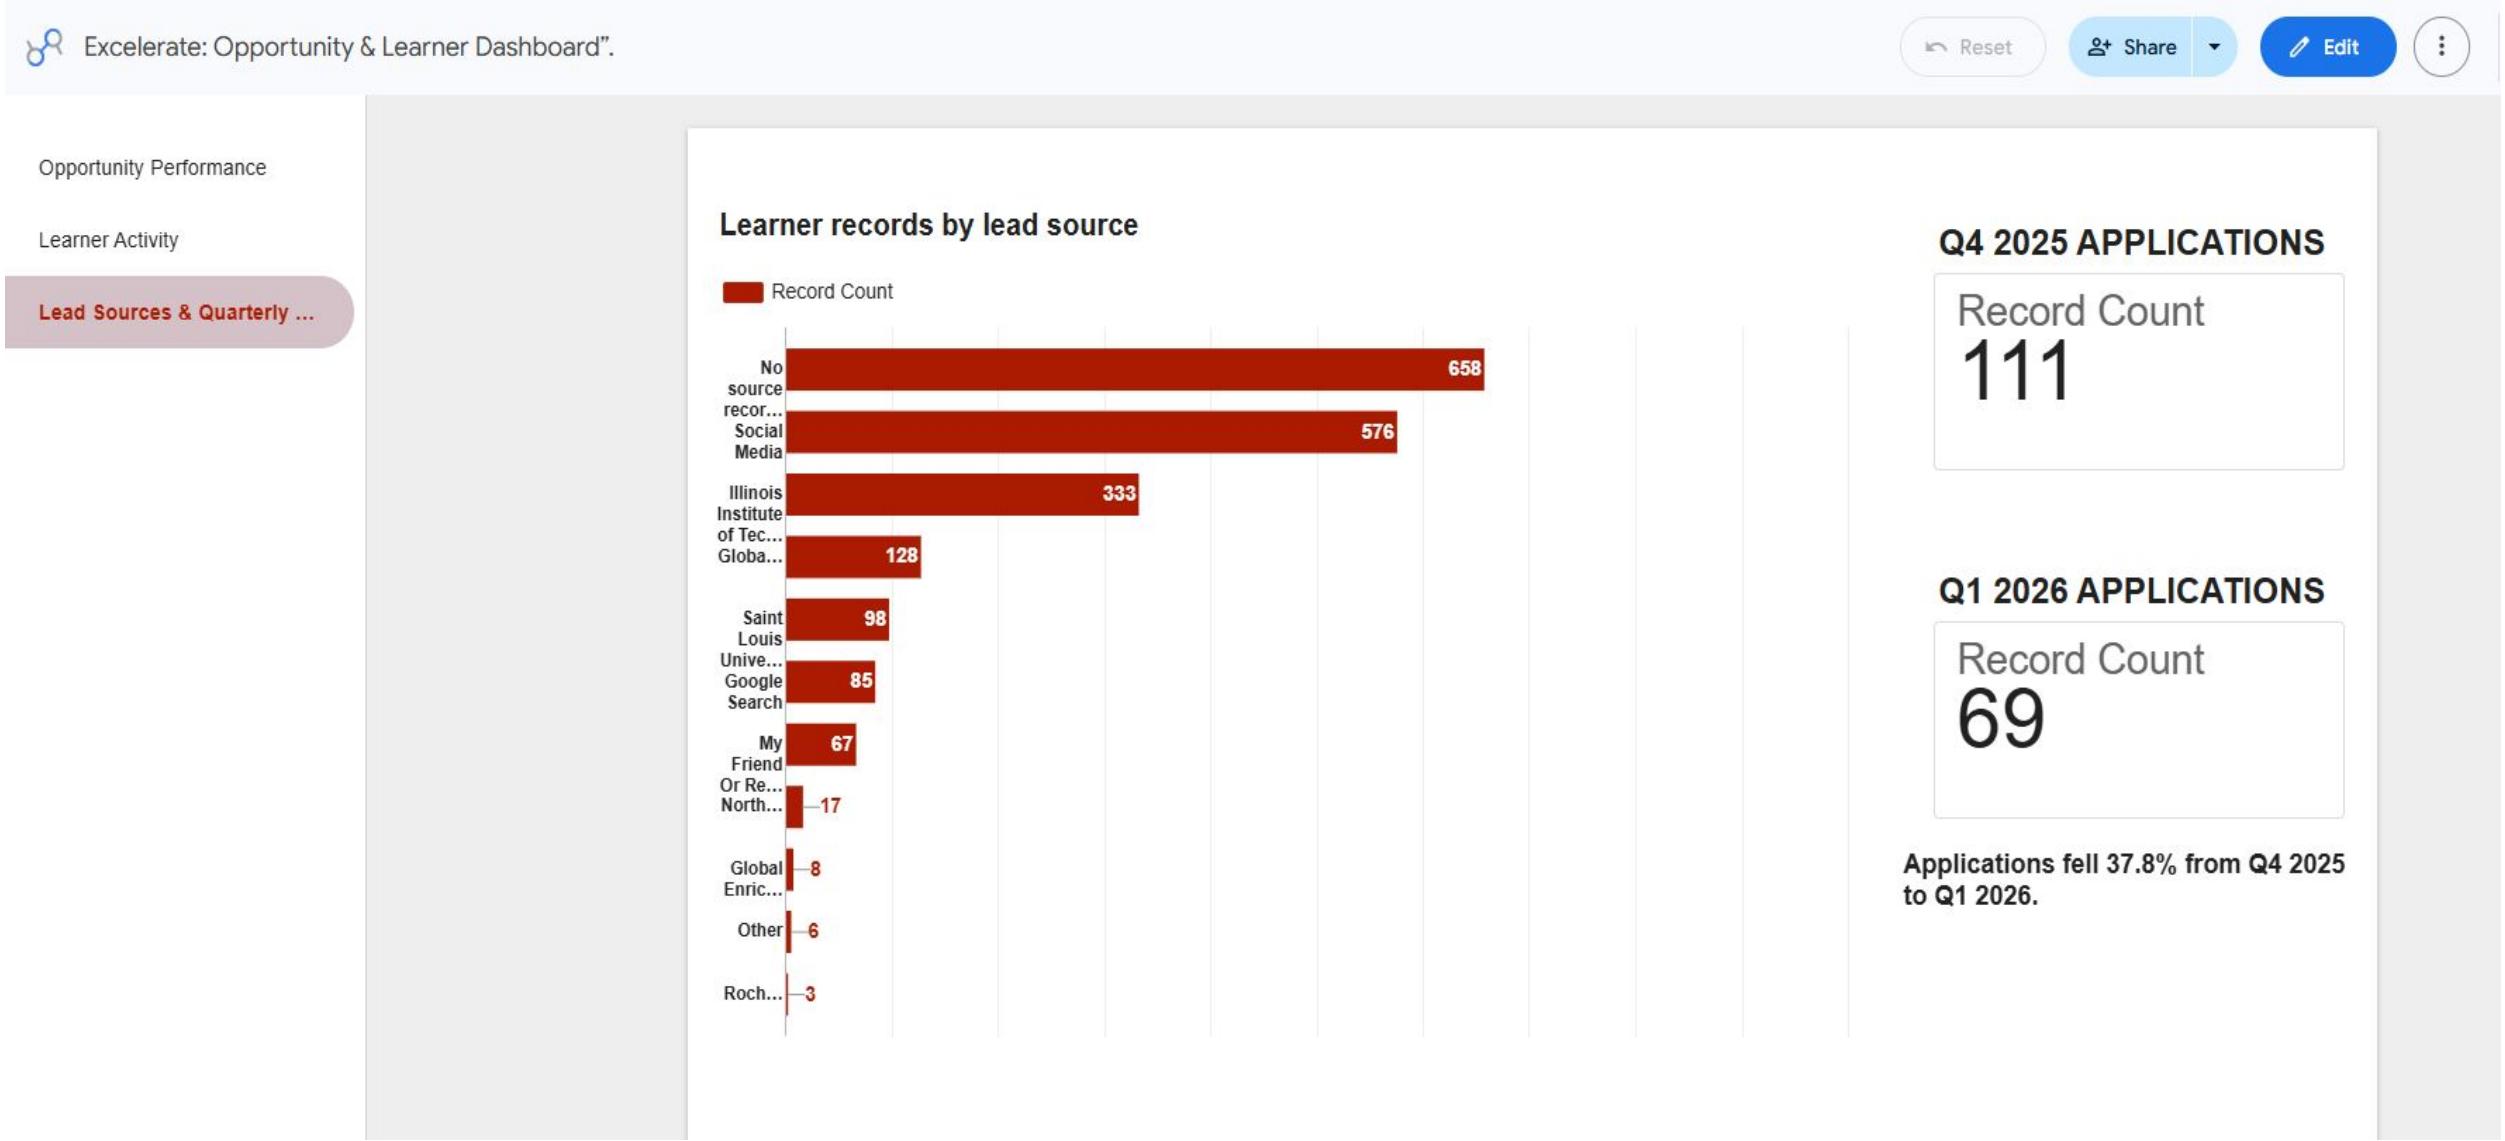

"Completion dates exist for 162 learners, but all of them sit in records with no category, so completions cannot be shown by category."

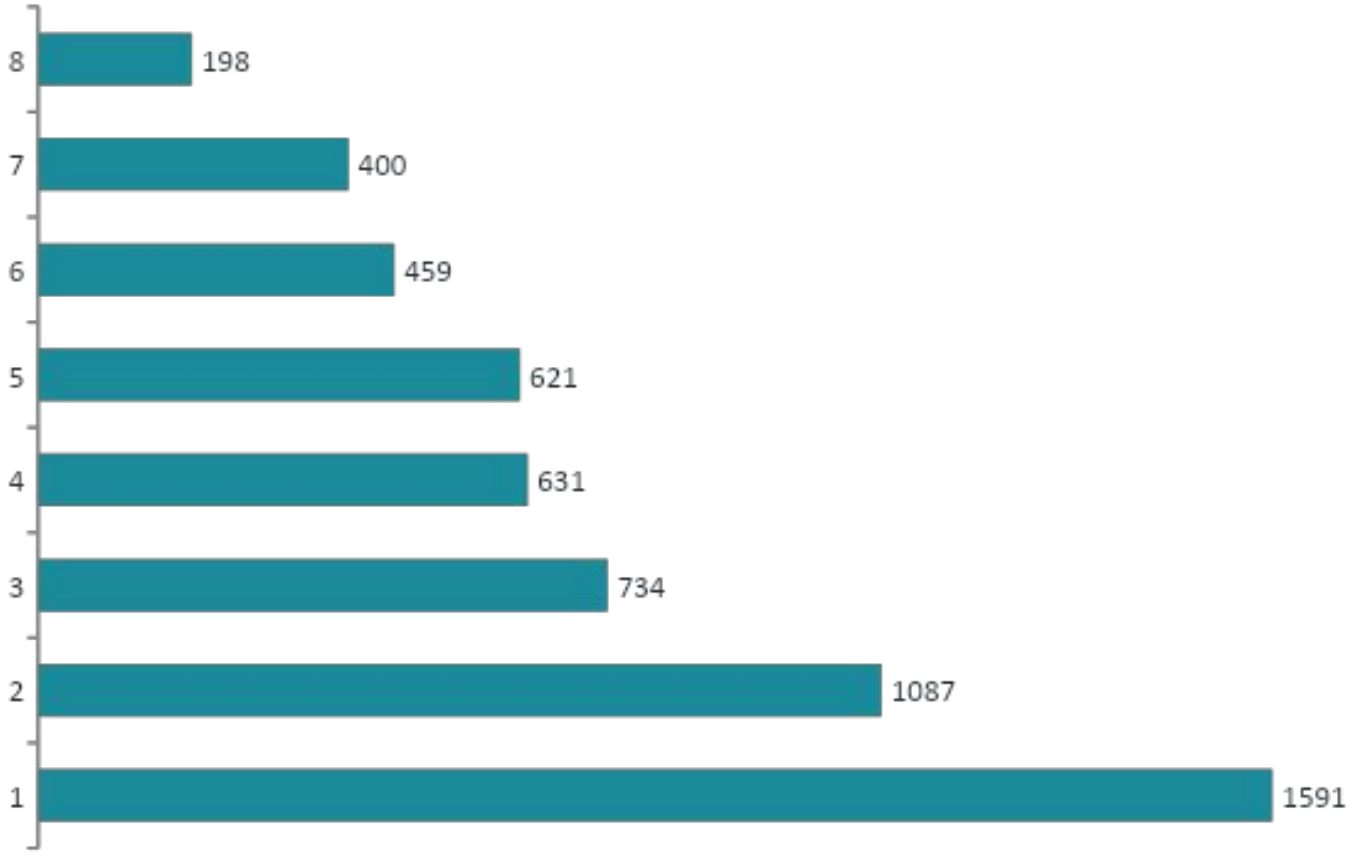

LEARNER ACTIVITY

LEAD SOURCES AND QUARTERLY TREND

Internships and careers dominate the opportunity mix

60%

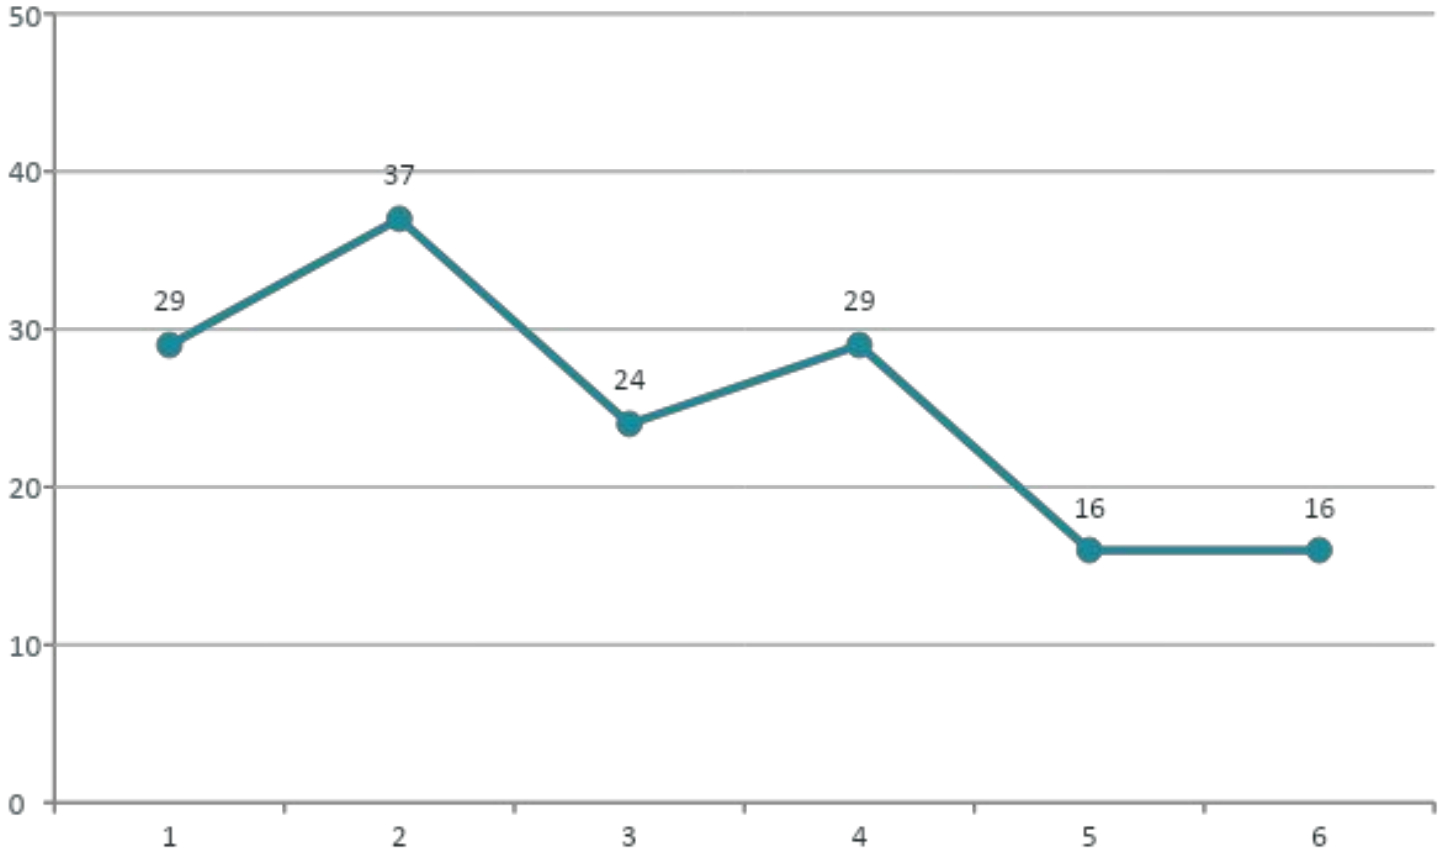

of the 5,727 opportunities are Internship, Career or Competition.

184.86

average Career fee, against under 5 for most other categories.

Fees are recorded in USD, INR and EUR, so averages are indicative.

Applications have fallen sharply since late 2025

-37.8%

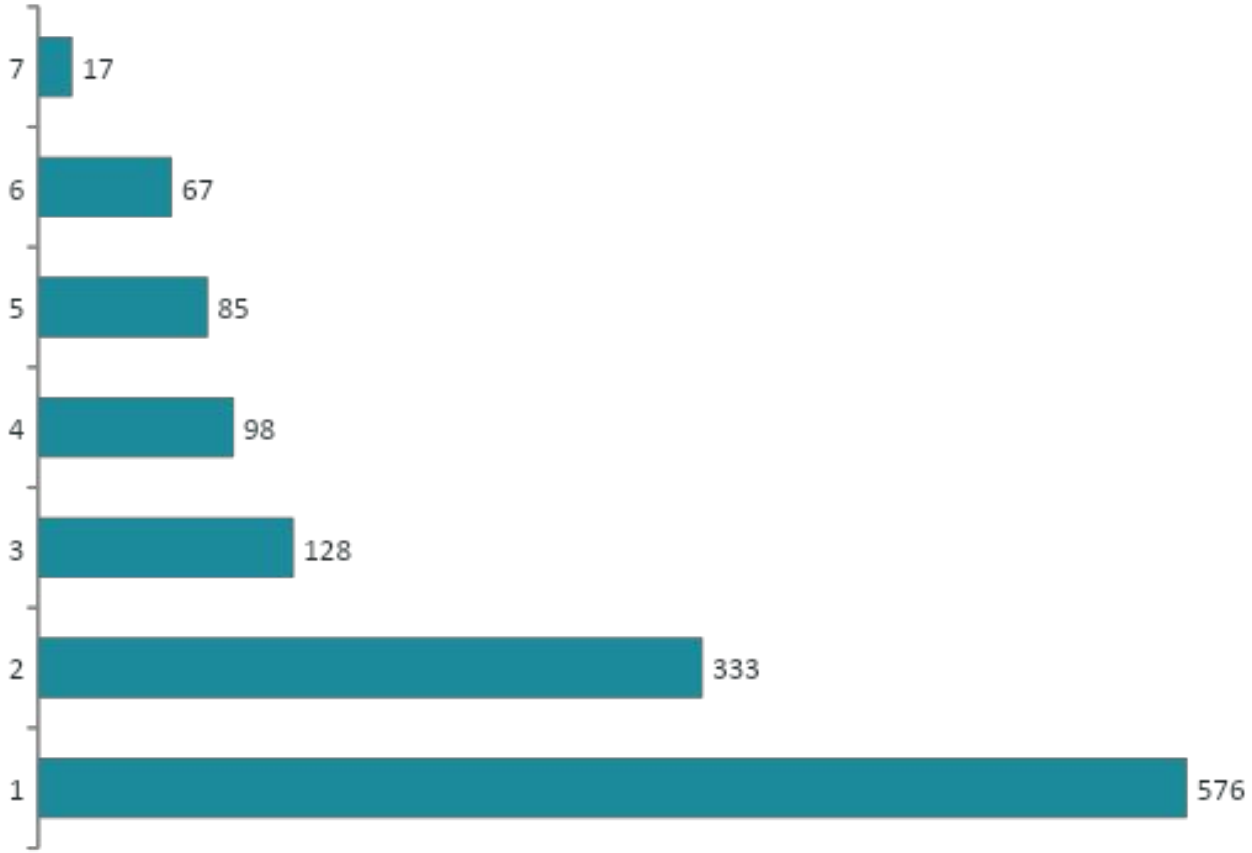

applications in Q1 2026 against Q4 2025 (111 down to 69).

-64%

from about 45 in October 2025 to 16 in March 2026.

**April covers 22 days; the data ends on 22 April 2026. October is derived from the Q4 total less November and December.*

Social media and partner universities bring in most learners

44%

Social Media share of known sources

34%

four partner universities combined

658

learners with no source recorded

Shares are of the 1,321 learners with a recorded source. Smaller sources are not shown.

Few learners are recorded as paid or completed

5.8%

of learners with a payment status are marked paid (77 of 1,335).

162

learners have a completion date (8%), and none of them has a category.

Five actions the data supports

1	**Make category, lead source and payment status mandatory at sign-up**	Missing for 68%, 33% and 33% of learner records.
2	**Investigate the drop in applications since October 2025**	Q1 2026 is 37.8% below Q4 2025; check campaign timing and extract completeness.
3	**Protect the two strongest channels**	Social media and partner universities bring about 78% of learners with a known source.
4	**Review payment follow-up**	Only 5.8% of learners with a payment status are marked as paid.
5	**Link each completion to an opportunity and a category**	All 162 completion dates sit in uncategorised records.

What the data cannot yet tell us

Current limits

- No record-level link between learners and opportunities
- Data ends on 22 April 2026, so April is a partial month
- Reward is embedded JSON, and fees mix currencies
- Status codes are undecoded and 212 columns are unnamed

Next steps

- Request a bridge export with an opportunity ID for each learner
- Obtain a status-code lookup and the missing column names
- Refresh the data beyond April 2026
- Extend the dashboard to completion rates per opportunity

Better data capture will unlock better decisions
